# Math 142 <br> Test \#2 <br> Spring 2022 <br> (Proof Portion) 

## Prove any three of the following four statements. Your choice!

Circle the 3 proofs you would like me to grade.
Should you wish, *star* the $4^{\text {th }}$ proof of your choice for me to grade as extra credit.
Use the given method where indicated. (Each proof is worth 5 points).

1. Prove:

If $m$ is even, then $m^{3}+2 m$ is divisible by 4 .

## Test Hypothesis:

## Proof:

2. Prove using an indirect proof:

$$
\text { If } n^{3} \text { is even, then } n \text { is even. }
$$

[HINT: Remember that $(x+y)^{3}=x^{3}+3 x^{2} y+3 x y^{2}+y^{3}$ ]

## Test Hypothesis:

## Proof:

3. Prove for any integer, $x^{2}+\mathrm{x}$ is always even. [HINT: Use two cases for x ].

## Test Hypothesis:

## Proof:

4. Using induction, prove that:

$$
1+3+6+10+\cdots \ldots \ldots \ldots \frac{n(n+1)}{2}=\frac{n(n+1)(n+2)}{6}
$$

## Test Hypothesis:

## Proof using Induction:
